# A SUMMARY OF PRESCRIBED BURNING DONE IN THE LAKE STATES DURING 1970

**ABSTRACT.** — Reports the results of a survey of operational prescribed burns in the Lake States during 1970.

**OXFORD:** 436(77):156:232.21. **KEY WORDS:** fire, site preparation, wildlife management.

A survey of land management agencies in the Lake States shows that approximately 20,000 acres were prescribed burned during 1970 (table 1), a 40-percent increase over 1969 and almost 100 percent more than in 1968. About half the total acreage was burned for hazard reduction. Wildlife habitat improvement comprised the second largest acreage; planting site preparation was third. During 1968 and 1969, 13,800 and 10,100 acres were burned, respectively (Sando 1969; 1971).

The 1970 field season had average spring burning conditions, but an unusual period of dry weather during July and August extended the summer burning season. However, the high fire danger during July and August probably limited the amount of burning that could be done. The high fire danger also increased the costs of some burns because of

more stringent control requirements and intensive mopup. Generally, cost per acre varied with size of burn.

As in the past, most of the prescribed burns for wildlife habitat management were made in the spring, although some fall burning was also done for this purpose. Experienced operators again accounted for the most acres burned. Besides the increased acreage, prescribed burning is generally being more widely used as a forest management tool.
